Biological Effects Of Electric And

Bioelectric potentials are generated by a variety of biological processes and generally range in strength from one to a few hundred millivolts. In the electric eel, however, currents of one ampere at 600 to 1,000 volts are generated. A brief treatment of bioelectricity follows. For full treatment, see electricity: Bioelectric effects.

Bioelectromagnetics, also known as bioelectromagnetism, is the study of the interaction between electromagnetic fields and biological entities. Areas of study include electromagnetic fields produced by living cells, tissues or organisms, the effects of man-made sources of electromagnetic fields like mobile phones, and the application of electromagnetic radiation toward therapies for the treatment of various conditions.

Both electric and magnetic fields induce voltages and currents in the body but even directly beneath a high voltage transmission line, the induced currents are very small compared to thresholds for producing shock and other electrical effects. Heating is the main biological effect of the electromagnetic fields of radiofrequency fields.

WHO | What are electromagnetic fields?

If electric current of sufficient magnitude is conducted through a living creature (human or otherwise), its effect will be to override the tiny electrical impulses normally generated by the neurons, overloading the nervous system and preventing both reflex and volitional signals from being able to actuate muscles.

Background: Many novel technologies, including induction cookers or wireless power transfer, produce electric fields (EF), magnetic fields (MF) or electromagnetic fields (EMF) in the intermediate frequency (IF) range. The effects of such fields on biological systems, however, have been poorly investigated. The aim of this systematic review was to provide an update of the state of research and ...

Biological effects of exposure to EMF were the focus in three studies (Blackman et al., 1988, Juutilainen and Lahtinen, 1985, Morales et al., 2009), but these studies also yielded inconsistent results regarding calcium efflux from brain tissue, erythrocyte sedimentation rate or the influence on the organ of Corti. The current evidence is ...
