In order, to implement dynamic multilevel indexing, B-tree and B+ tree are generally employed. The drawback of B-tree used for indexing, however is that it stores the data pointer (a pointer to the disk file block containing the key value), corresponding to a particular key value, along with that key value in the node of a B-tree.

Databases are good at data abstraction that hides the complexity from basic users, and control data redundancy. For client datasets, multilevel undo support is provided that makes it easy to perform operations on data. It has minimized data inconsistency which means different files might contain different information about an object or a person.
